Outline

1. Density Evolution for the Binary Erasure Channel
2. From LDPC Block to LDPC Convolutional Codes
3. Threshold Results
4. Conclusion

Recap: Density Evolution

Recap: Density Evolution

- Density evolution provides a **threshold** that divides the channel parameter range into **an admissible** and **a non-admissible region**.

Recap: Density Evolution

- Density evolution provides a **threshold** that divides the channel parameter range into **an admissible** and **a non-admissible region**.
- Consider the **binary erasure channel**:

$$C = 1 - \epsilon$$

Recap: Density Evolution

- Density evolution provides a **threshold** that divides the channel parameter range into **an admissible** and **a non-admissible region**.
- Consider the **binary erasure channel**:

$$C = 1 - \varepsilon$$

- Here, density evolution is particularly simple: Track **the average probability $p^{(l)}$ of an erasure** after l iterations.
 - $(l = 0)$: 0 1 0 e 1 0 1 e e 1 0 ... $p^{(0)} = \varepsilon$
 - $(l = 1)$: 0 1 0 0 1 0 1 1 e 1 0 ... $p^{(1)} = ?$
 - ...

Recall the Sum-Product Algorithm

Recall the Sum-Product Algorithm

- Channel:

$$L_j = \begin{cases} +\infty, & y_j = 0 \\ -\infty, & y_j = 1 \\ 0, & y_j = e \end{cases}$$

Recall the Sum-Product Algorithm

- Channel:

$$L_j = \begin{cases} +\infty, & y_j = 0 \\ -\infty, & y_j = 1 \\ 0, & y_j = e \end{cases}$$

- Check node (CN) update:

$$L_{i \rightarrow j} = 2 \tanh^{-1} \left(\prod_{j' \in N(i) - \{j\}} \tanh \left(\frac{1}{2} L_{j' \rightarrow i} \right) \right)$$

Recall the Sum-Product Algorithm

- Channel:

$$L_j = \begin{cases} +\infty, & y_j = 0 \\ -\infty, & y_j = 1 \\ 0, & y_j = e \end{cases}$$

- Check node (CN) update:

$$L_{i \rightarrow j} = 2 \tanh^{-1} \left(\prod_{j' \in N(i) - \{j\}} \tanh \left(\frac{1}{2} L_{j' \rightarrow i} \right) \right)$$

- Variable node (VN) update:

$$L_{j \rightarrow i} = L_j + \sum_{i' \in N(j) - \{i\}} L_{i' \rightarrow j}$$

Recall the Sum-Product Algorithm

- $p^{(l)}$: probability that **an outgoing VN message is an erasure**, with $p^{(0)} = \varepsilon$

Recall the Sum-Product Algorithm

- $p^{(l)}$: probability that **an outgoing VN message is an erasure**, with $p^{(0)} = \varepsilon$
- $q^{(l)}$: probability that **an outgoing CN message is an erasure**

Recall the Sum-Product Algorithm

- $p^{(l)}$: probability that **an outgoing VN message is an erasure**, with $p^{(0)} = \varepsilon$
- $q^{(l)}$: probability that **an outgoing CN message is an erasure**
- **CN update** (degree k):

$$q^{(l)} = 1 - (1 - p^{(l-1)})^{k-1}$$

Recall the Sum-Product Algorithm

- $p^{(l)}$: probability that **an outgoing VN message is an erasure**, with $p^{(0)} = \varepsilon$
- $q^{(l)}$: probability that **an outgoing CN message is an erasure**
- **CN update** (degree k):

$$q^{(l)} = 1 - (1 - p^{(l-1)})^{k-1}$$

Recall the Sum-Product Algorithm

- $p^{(l)}$: probability that **an outgoing VN message is an erasure**, with $p^{(0)} = \varepsilon$
- $q^{(l)}$: probability that **an outgoing CN message is an erasure**
- **CN update** (degree k):

$$q^{(l)} = 1 - (1 - p^{(l-1)})^{k-1}$$

Recall the Sum-Product Algorithm

- $p^{(l)}$: probability that **an outgoing VN message is an erasure**, with $p^{(0)} = \varepsilon$
- $q^{(l)}$: probability that **an outgoing CN message is an erasure**
- **CN update** (degree k):

$$q^{(l)} = 1 - (1 - p^{(l-1)})^{k-1}$$

- **VN update** (degree k):

$$p^{(l)} = \varepsilon (q^{(l)})^{k-1}$$

Recall the Sum-Product Algorithm

- $p^{(l)}$: probability that **an outgoing VN message is an erasure**, with $p^{(0)} = \varepsilon$
- $q^{(l)}$: probability that **an outgoing CN message is an erasure**
- **CN update** (degree k):

$$q^{(l)} = 1 - (1 - p^{(l-1)})^{k-1}$$

- **VN update** (degree k):

$$p^{(l)} = \varepsilon (q^{(l)})^{k-1}$$

Recall the Sum-Product Algorithm

- $p^{(l)}$: probability that **an outgoing VN message is an erasure**, with $p^{(0)} = \varepsilon$
- $q^{(l)}$: probability that **an outgoing CN message is an erasure**
- **CN update** (degree k):

$$q^{(l)} = 1 - (1 - p^{(l-1)})^{k-1}$$

- **VN update** (degree k):

$$p^{(l)} = \varepsilon (q^{(l)})^{k-1}$$

Recall the Sum-Product Algorithm

- $p^{(l)}$: probability that **an outgoing VN message is an erasure**, with $p^{(0)} = \varepsilon$
- $q^{(l)}$: probability that **an outgoing CN message is an erasure**
- **CN update** (degree k):

$$q^{(l)} = 1 - (1 - p^{(l-1)})^{k-1}$$

- **VN update** (degree k):

$$p^{(l)} = \varepsilon (q^{(l)})^{k-1}$$

- Averaged over all VNs and CNs ($\lambda(x)$ is the **VN degree distribution**, $\rho(x)$ is the **CN degree distribution**):

$$p^{(l)} = \varepsilon \lambda(1 - \rho(1 - p^{(l-1)}))$$

Threshold Example (Capacity $C = 0.5$)

Example

- Regular (3, 6) LDPC block code ensemble, rate $R = 1/2$:

$$\rho(x) = x^5 \quad \lambda(x) = x^2$$

- Threshold $\varepsilon^* = 0.429$

Example

- Regular (5, 10) LDPC block code ensemble, rate $R = 1/2$:

$$\rho(x) = x^9 \quad \lambda(x) = x^4$$

- Threshold $\varepsilon^* = 0.341$

Density Evolution for Protograph Ensembles

Density Evolution for Protograph Ensembles

- Protograph = **prototype graph**

Density Evolution for Protograph Ensembles

- Protograph = **prototype graph**
- Tanner graph of the code results from a **copy-and-permute** procedure that **preserves the degree distribution of all nodes**

Density Evolution for Protograph Ensembles

- Protograph = **prototype graph**
- Tanner graph of the code results from a **copy-and-permute** procedure that **preserves the degree distribution of all nodes**
- Imposes structure on the resulting LDPC code ensemble

Density Evolution for Protograph Ensembles

- Protograph = **prototype graph**
- Tanner graph of the code results from a **copy-and-permute** procedure that **preserves the degree distribution of all nodes**
- Imposes structure on the resulting LDPC code ensemble
- Now the erasure probabilities are **functions of the edges**:

$$q^{(l)}(e_{i \rightarrow j}) = 1 - \prod_{j' \in N(i) - \{j\}} (1 - p^{(l-1)}(e_{j' \rightarrow i}))$$

$$p^{(l)}(e_{j \rightarrow i}) = \varepsilon \prod_{i' \in N(i) - \{j\}} q^{(l)}(e_{i' \rightarrow j})$$

Spatial Coupling via “Edge Spreading”

Spatial Coupling via “Edge Spreading”

Spatial Coupling via “Edge Spreading”

Spatial Coupling via “Edge Spreading”

Properties

Properties

- Parity check matrix has a **convolutional-like structure**:

$$B = \begin{pmatrix} 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 1 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 \end{pmatrix}$$

Properties

- Parity check matrix has a **convolutional-like structure**:

$$B = \begin{pmatrix} 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 1 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 \end{pmatrix}$$

- Rate loss** due to termination (additional check nodes)

Properties

- Parity check matrix has a **convolutional-like structure**:

$$B = \begin{pmatrix} 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 1 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 \end{pmatrix}$$

- Rate loss** due to termination (additional check nodes)
- Slight **irregularities of the CN degrees** at the beginning and end of the protograph

Properties

- Parity check matrix has a **convolutional-like structure**:

$$B = \begin{pmatrix} 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 1 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 \end{pmatrix}$$

- Rate loss** due to termination (additional check nodes)
- Slight **irregularities of the CN degrees** at the beginning and end of the protograph
- However, as the number of protograph copies L grows large, the code becomes **asymptotically regular** and **the rate loss becomes negligible**

Thresholds for Protograph-based LDPC Convolutional Codes

Thresholds for Protograph-based LDPC Convolutional Codes

- Based on (3,6) LDPC Block protograph ($\varepsilon^* = 0.429$):

L	R_L	ε_L^*	$\varepsilon_{Sh}(R_L)$
5	0.300	0.587	0.700
10	0.400	0.504	0.600
20	0.450	0.488	0.550
40	0.475	0.488	0.525
∞	0.500	0.488	0.500

Thresholds for Protograph-based LDPC Convolutional Codes

- Based on (3,6) LDPC Block protograph ($\varepsilon^* = 0.429$):

L	R_L	ε_L^*	$\varepsilon_{Sh}(R_L)$
5	0.300	0.587	0.700
10	0.400	0.504	0.600
20	0.450	0.488	0.550
40	0.475	0.488	0.525
∞	0.500	0.488	0.500

- Based on (5,10) LDPC Block protograph ($\varepsilon^* = 0.341$):

L	R_L	ε_L^*	$\varepsilon_{Sh}(R_L)$
5	0.100	0.625	0.900
10	0.300	0.512	0.700
20	0.400	0.499	0.600
40	0.450	0.499	0.550
∞	0.500	0.499	0.500

Erasure Probability Evolution at $\varepsilon = 0.483$, $L = 20$, (3,6) LDPC code

Conclusion

Conclusion

- Asymptotically regular protograph ensembles are **capable of approaching capacity**

Conclusion

- Asymptotically regular protograph ensembles are **capable of approaching capacity**
- Spatial coupling and termination leads to **slight irregularities of the CN degrees**

Conclusion

- Asymptotically regular protograph ensembles are **capable of approaching capacity**
- Spatial coupling and termination leads to **slight irregularities of the CN degrees**
- Same effect is also **present for other channels, e.g., AWGN**

Thank you!
